

B Pathway-level signed NES (module level; * = FDR/adj. P < 0.05 as frozen in C1)
 Pathway-level signed NES (module level; * = FDR/adj. P < 0.05 as frozen in C1)

Shared anti-proliferative / ER-UPR programmes are more consistently down across conventional electric-field comparators than across the HITMAN fields (module-level descriptive summary). U87-MG 10-V column is the outlier comparator that broadly activates most pathways (N11). Gene-level signed concordance with comparators is absent (U87MG-TTFields rho=-0.10, KNS42-DBS rho=-0.09; N15). C5 cross-platform: U87MG TTFields rho=-0.024 (n.s.); C5 stable set dir_concord=0.5231 (N12). C5 is therefore reported as a HITMAN-field-specific interaction programme, not a field-general signature. (A) U87-MG untreated n = 2 (comparator-outlier caveat, N11); SREBP/cholesterol and interferon programmes are the HITMAN-enriched sets; C5 is not reproduced on conventional electric-field platforms (N12).
